COMMONWEALTH

Purpose

The Gladstone Elementary School is proposed to be reconstructed. The reconstruction will include a new and relocated building, changes to access to the site, increased on-site parking and improved circulation, and an increase in available student enrollment capacity. This Traffic Impact Analysis will summarize the analysis results, site impact evaluations, and findings completed by Commonwealth Engineers & Consultants, Inc. ("CE&C") for the changes proposed to Gladstone Elementary School.

Preliminary Description

Gladstone Elementary School is located on approximately 7.8 acres at the southern corner of the intersection of Browne Street, Gladstone Street, & Lawrence Street in Cranston, Rhode Island. The school was built in 1952 and currently has an enrollment capacity of 550 students from pre-kindergarten through grade 5. Gladstone Elementary School has a private street near the eastern border of the site connecting Gladstone Street and Asia Street, which is primarily used for buses and limited parking for staff. The primary on-site parking lot is accessed at the intersection of Browne Street, Gladstone Street, & Lawrence Street. A secondary parking lot is provided off Lawrence Street adjacent to an existing playground which will remain. A crossing guard for the intersection at the main entrance of the school currently stops traffic on Lawrence Street at school arrival and dismissal peaks. Parents and students get in/out of those stopped vehicles until after the peaks when the crossing guard allows traffic flow through Lawrence Street. Parents also park on Laurel Hill Avenue, Gladstone Street and Browne Street to drop-off/pick-up children. A pedestrian gate exists on the school property at Elwyn Street, along with a sidewalk towards the main entrance of the building. Pedestrian access is possible via Oxford Street though no sidewalk connection is provided. Gladstone Street between Browne Street and Cranston Street has prohibited parking; do not enter signs are posted on Gladstone Street at Cranston Street the restrict entering Gladstone Street westbound on school days between 7:30 AM–9:00 AM and 2:00 PM–3:00 PM. A vicinity map is provided as **Figure 1**.

Analysis Procedure

Key intersections within the vicinity of the project site were evaluated for existing conditions and projected conditions with the proposed changes. This study includes the following key intersections:

- Laurel Hill Avenue & Oxford Street
- Laurel Hill Avenue & Elwyn Street
- Laurel Hill Avenue & Lawrence Street
- Browne Street, Gladstone Street, & Lawrence Street
- Cranston Street & Gladstone Street
- Cranston Street & Asia Street

Vehicular trip generation were approximated for the site with the proposed changes and applied to the roadway network to approximate how the intersections would operate in the future. Internal queuing from drop-off/pick-up route were evaluated. Pedestrian/bicyclist access to the site were also evaluated for the proposed layout.

COMMONWEALTH

Figure 1 – Vicinity Map

COMMONWEALTH

Proposed Changes

Gladstone Elementary School is proposed to have improved facilities with an expanded enrollment capacity to 800 students, an increase of 250 students. The existing building will be demolished, and a new building constructed in a new location on the parcel. On-site parking will increase from 68 marked spaces (including 12 unmarked spaces on the bus route) and a bus drop-off/pick-up route to 100 spaces, a bus drop-off/pick-up route, and a parent drop-off/pick-up route.

The existing private street will remain and be partially widened to include some parallel parking. A parking lot will be provided near the southeast corner of the parcel adjacent to the new school building with access to the private street. The private street will also provide access to a new parking lot near the north corner of the parcel. From this parking lot a one-way drive aisle with a drop-off/pick-up zone for students is provided which exits to Lawrence Street. A loop for bus drop-off/pick-up with a 11 parking spaces will also access Lawrence Street. The existing main on-site parking lot and its associated access to Gladstone Street, Lawrence Street, and Brown Street, will be removed, leaving the intersection as a 4-legged intersection. The existing playground and parking lot at the northwest corner of the parcel will remain. **Figure 2** depicts the proposed site layout dated March 24, 2023, upon which the conclusions and recommendations of this analysis are based.

Vehicular Volume

Trip Generation

With the expanded maximum student enrollment, the school is expected to generate more trips following completion of the proposed reconstruction. Trips generated by a site are often estimated using equations provided within *Trip Generation Manual*, 11th Edition published by the *Institute of Transportation Engineers*. The manual includes a land use code for public elementary schools which is used to approximate existing trips and potential future trips under the proposed changes.

Trips associated with an expanded site such as Gladstone Elementary School can sometimes be estimated by multiplying existing trips with a growth factor. Unfortunately, the existing trips is not able to be counted due to extensive off-site parking throughout the neighborhood; most vehicles never entered the site, and many vehicles did not enter the ad-hoc parking lot created by the crossing guard. As such, any count at intersections and driveways would not result in a reasonably accurate trip count.

COMMONWEALTH

Figure 2 – Site Plan

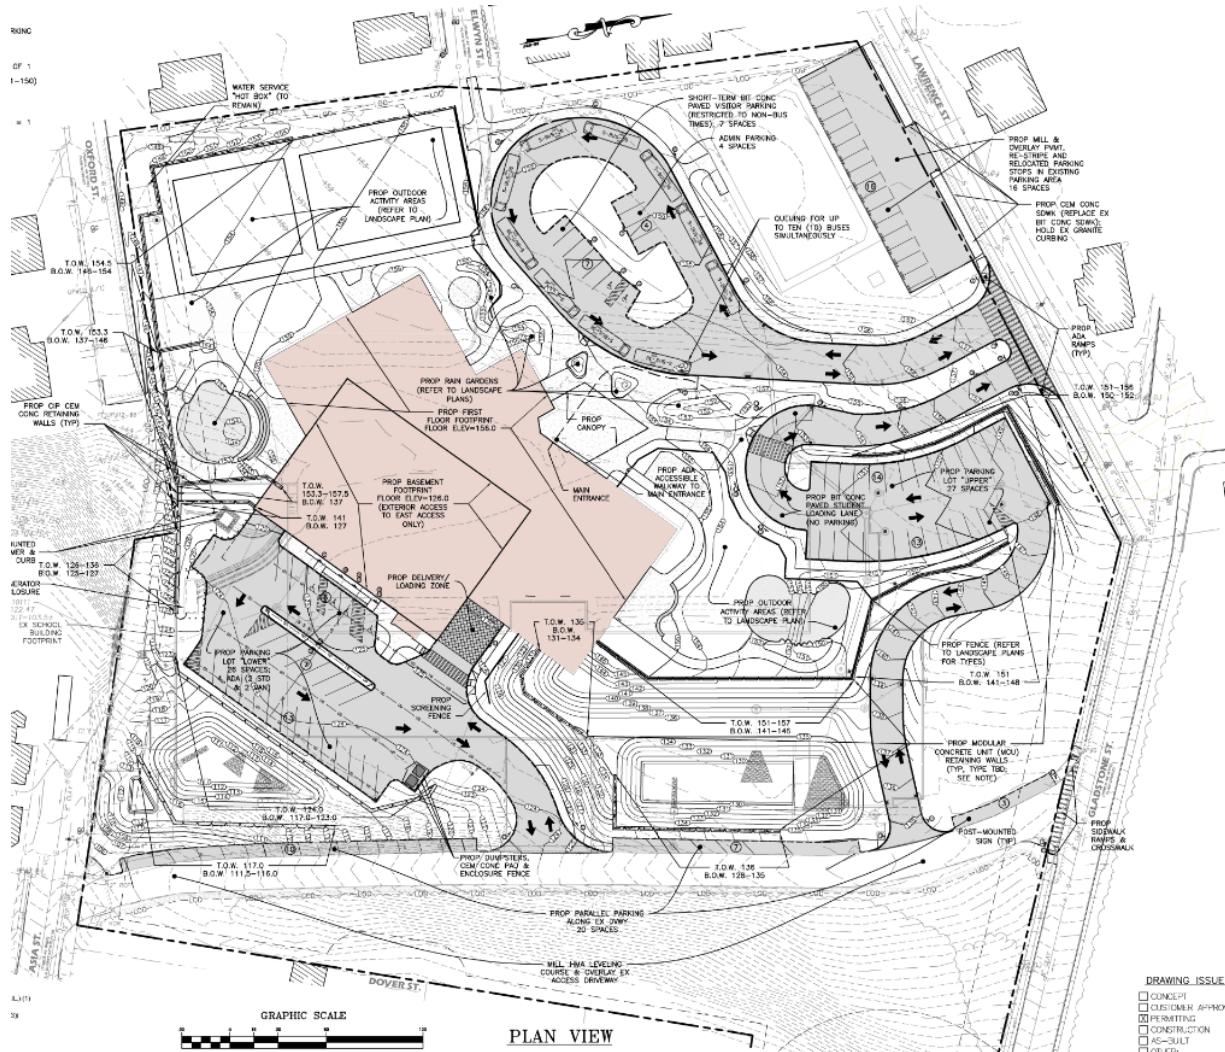

Table 1 summarizes expected vehicular trips generated by the site. The proposed school at maximum enrollment is expected to generate 1,816 daily trips during a typical weekday, with 600 trips (324 in, 276 out) during the AM peak hour and 360 trips (166 in, 194 out) during the school afternoon dismissal peak hour. This is approximately 45% more trips than the existing school enrolment capacity and 69% more trips than the existing school attendance on the day intersection traffic counts were performed. The traffic counts noted 7 buses during the peak hour; the proposed school layout provides space for 10 buses.

Table 1 – Trip Generation Approximation

Condition	Students	Daily	AM Peak Hour			School Dismissal Peak Hour		
			Total	In	Out	Total	In	Out
Attendance on day of traffic counts	473	1,074	192	163	355	98	115	213
Current maximum enrollment	550	1,249	223	190	413	114	134	248
Proposed maximum enrollment	800	1,816	324	276	600	166	194	360

COMMONWEALTH

Trip Distribution

The projected trip generation is to be added along routes to and from the site to approximate future traffic volumes. Traffic volumes recorded during the traffic counts were reviewed in an effort to approximate demand to/from outside of the study area. This distribution is used to project future trips via existing routes and proposed access points. **Table 2** summarizes the percentages applied to route trips to/from the site.

Table 1 – Trip Generation Approximation

Travel Direction To/From	In	Out
North - Laurel Hill Avenue	35%	30%
North – Cranston Street	10%	15%
South - Laurel Hill Avenue	35%	20%
South – Cranston Street	15%	30%
West – Lawrence Street	5%	5%
Totals	100%	100%

Existing and Projected Volumes

Intersection traffic volume counts at the study intersections were performed in February 2022 at 7 AM – 9 AM and 2 PM – 4 PM on a typical school day. Roadway segment volume counts were conducted on Laurel Hill Avenue, Lawrence Street, and Asia Street. These traffic volumes are considered as a base for existing conditions for proceeding analyses. Peak hour traffic volumes during existing conditions at the study intersections are depicted in **Figure 3** and **Figure 4**. Peak hour traffic volumes generated by the site are depicted in **Figure 5** and **Figure 6**. The area surrounding the school is well established and is not expected to have change in the near future; existing traffic volume, less volumes associated with the school, are expected to remain consistent and this evaluation does not apply an overall growth factor for projected conditions. The projected traffic volumes generated by the site were added to adjusted existing traffic volumes adjustments were made to remove a portion of trips to/from the school as existing to lessen the effect of double counting school trips. Not all existing trips to/from the school could be removed as extensive off-site parking prevented an accurate count. Projected future peak hour traffic volumes with the proposed reconstruction is depicted in **Figure 7** and **Figure 8**. Existing and future traffic volumes along roadway segments are depicted on **Figure 9**.

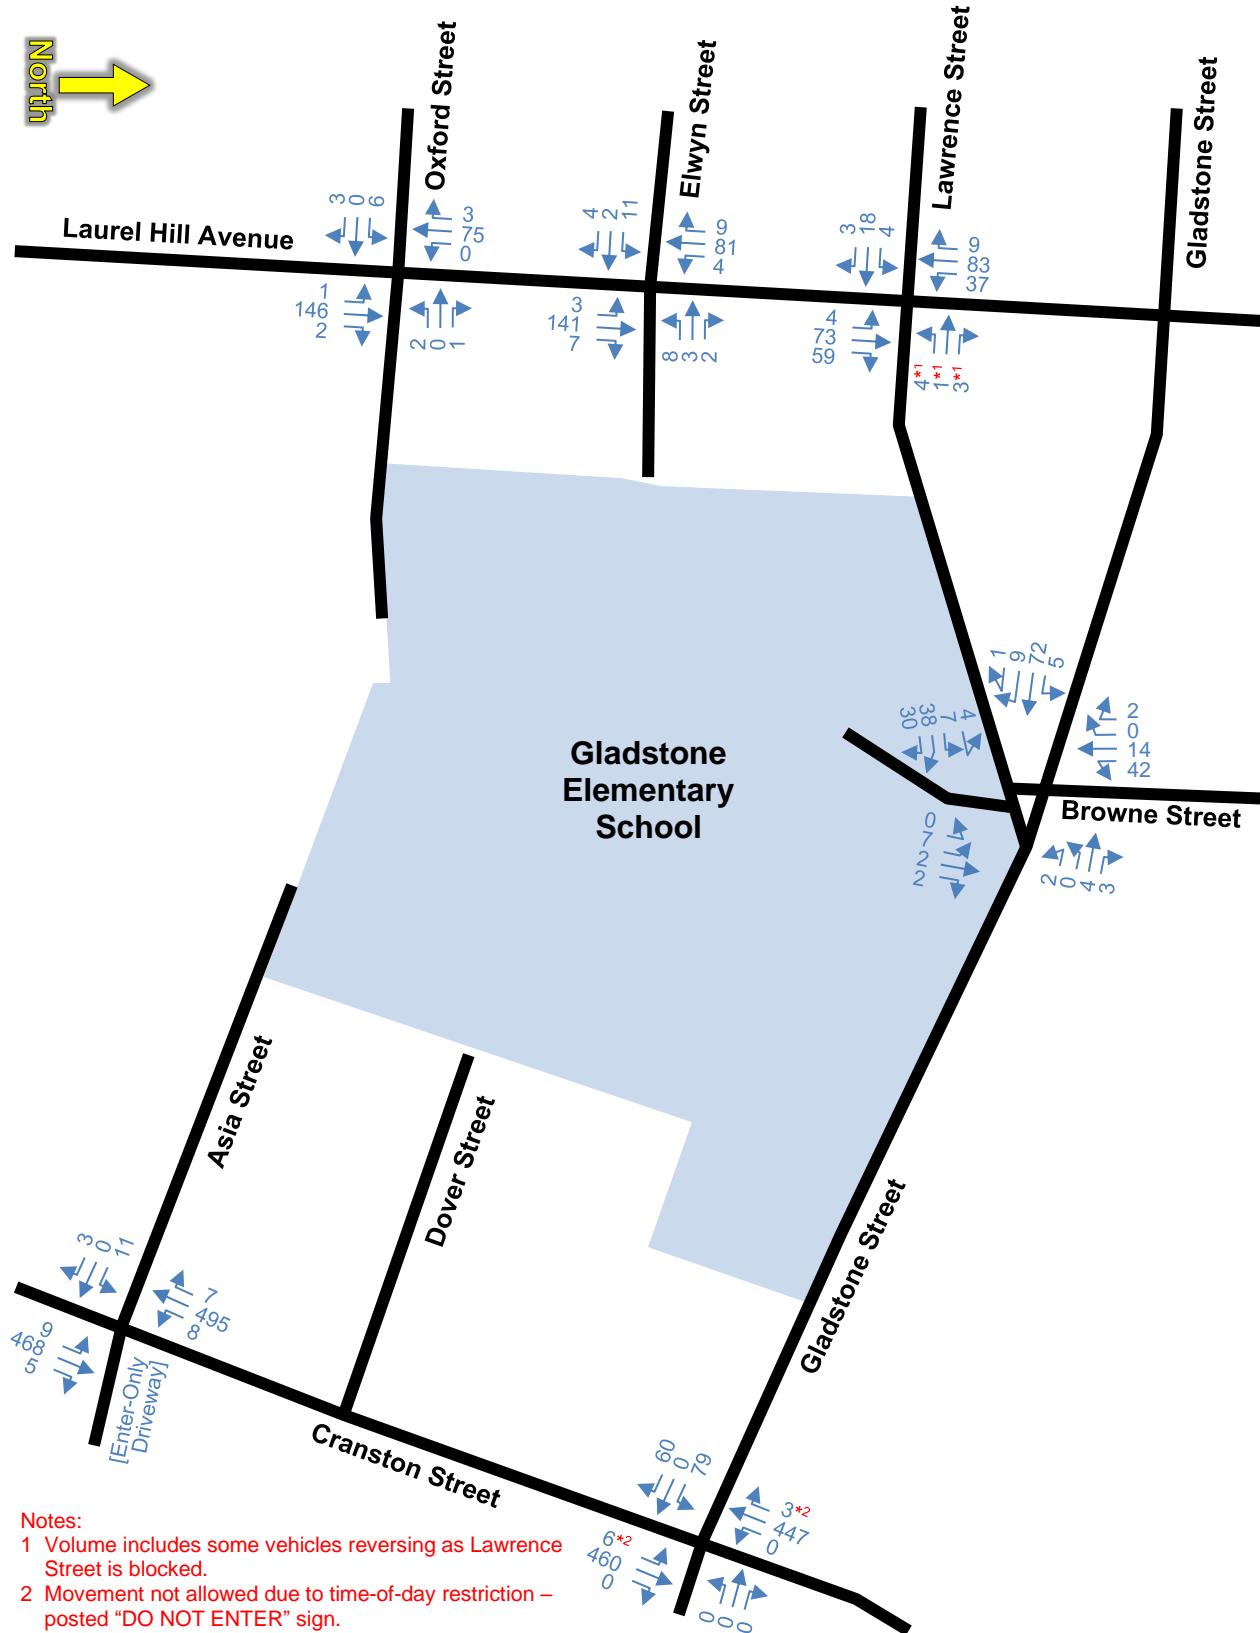

Intersection Capacity Analysis

Analysis of intersections is commonly performed using traffic modelling software that uses multiple algorithms produced by the *Highway Capacity Manual*, published by the Transportation Research Board. Intersection capacity analysis through this methodology provides results as a letter grade “A” through “F” which represent an approximate stopped-delay experienced. LOS results may be analyzed by individual movements and an intersection overall if applicable. Level of Service (“LOS”) A represents little to nearly no delay whereas LOS F represents heavy delays. LOS ratings themselves do not indicate that an intersection operates acceptably or not but may be used as a reference point when evaluating conditions. The determination on what is deemed acceptable can be subjective and may differ based on the types of roadways intersecting, the density/rural characteristics of the area, and presence of vulnerable/non-vehicular users.

COMMONWEALTH

LOS Results

The analysis performed and summarized herein was completed utilizing Synchro traffic modelling software for the AM peak hour and school dismissal peak hour for both existing and proposed future conditions. The results of the analysis are presented in **Table 3** for existing and future proposed conditions, respectively.

Table 3 – Intersection Capacity Analysis LOS Results

Notes:

- 1) LOS is not applicable for free-flow movements. Overall/intersection LOS is not applicable for intersections with free-flow movements. Where no volume recorded, “-” is displayed.
- 2) School dismissal afternoon peak hour analyzed; negligible impact to traditional PM peak hour is expected.
- 3) Due to typical closures of roadway by school employee, queuing on Lawrence Street backs into the intersection; therefore, HCM analysis and resulting LOS does not reflect actual conditions.
- 4) HCM analysis not capable of analyzing 5-approach all-way stop-controlled intersections.
- 5) Existing LOS is not applicable as existing private street 1 one-way, bus-only and buses may not approach from Cranston Street.

The eastbound approach to the intersection of Cranston Street and Gladstone Street currently operates at LOS D during the school peak hours and is projected to operate at LOS E during the school dismissal peak hour with 40 seconds of delay on average per vehicle. All movements at the intersection of Cranston Street and Asia Street are

COMMONWEALTH

projected to operate at LOS C or better during the school peak hours. All other intersections are projected to operate at LOS B or better during the school peak hours.

Traffic conditions will improve particularly on Lawrence Hill Avenue and the proposed layout of Gladstone will not require Lawrence Street between Laurel Hill Avenue and Gladstone Street to be blocked off during the school peak hours.

Parking and Circulation Evaluation

Where available, schools commonly employ a drop-off/pick-up area to facilitate safe, faster and orderly flow of vehicles. The proposed school layout includes a drop-off/pick-up area and a route for vehicles to queue. The area for unloading/loading is approximately 125 feet in length along the curb which could fit up to 4 vehicles. Beyond the drop-off/pick-up area is adequate space for vehicles to egress the area before arriving/queuing at the access to Lawrence Street. The analysis projected the driveway to experience 10.5-14.6 seconds of delay per vehicle, or 42-58 seconds per 4 vehicles. CE&C recommends that the parking lot immediately prior to the drop-off/pick-up area be dedicated for school staff members that do not need to arrive/depart during peak queuing times. This will minimize vehicles entering/exiting parking spaces while there are queued vehicles in the area. Similarly, CE&C recommends the parking spaces within the bus loop to be dedicated to staff parking during typical school hours. On-site queuing available includes approximately 400 feet to the existing private street which is approximately 620 feet. This provides 1,020 feet of internal storage on-site for queuing. For this school, CE&C estimates a queuing rate will typically be less than 4.0 feet per enrolled student. With a maximum enrollment of 800 students this equates to approximately 1,600 feet of queue length after applying a discount for 400 students (up to 10 buses on-site simultaneously). As such, some queuing off-site is expected, which could occur on Gladstone Street and Lawrence Street on the north of the school, or Asia Street.

The parking lot directly in front of the school is available for parents that need to park and walk-in/walk-out of the school facilities. It is recommended that this parking lot remain available for parking and not used as a secondary curb-side drop-off pick up location to remain accessible for parking needs. Additional parking is provided in the existing playground parking lot on the northwest corner of the parcel as well as some parallel parking is proposed along the existing private street. These additional parking areas will partially alleviate traffic conditions at the school during the AM and PM drop-off/pick-up times.

Queuing off-site is not uncommon for neighborhood public schools and while less than ideal for traffic in the neighborhood, traffic impacts from the school within the adjacent neighborhood is expected to be drastically reduced with the proposed site changes even with the increase in students due to the addition of off-street queue storage. It is recommended that the school encourages arriving vehicles from Laurel Hill Avenue to use Gladstone Street and avoid Lawrence Street except for buses and vehicles parking at the existing playground. This will assist to improve circulation flow of traffic leaving the school driveways on Lawrence Street.

The school currently provides approximately 68 parking spaces on-site. The school is proposed to provide 100 parking spaces (an increase by 47%) as well as the drop-off/pick-

COMMONWEALTH

up zone which will reduce the demand for parking during arrival/dismissal times. The school could potentially allow parking within the bus loop during night events.

The city may consider the potential to make Gladstone Street 1-way at all times between Browne Street and Cranston Street. This would allow eastbound neighborhood vehicles to pass potentially queued vehicles to the school during pick-up/drop off times and potentially additional parking for night events if needed. While this may be considered it is not recommended at this time and CE&C defers to local preference of the neighborhood, city officials, and emergency services. Additional restriction signage (no right turns, no left turns) at Cranston Street facing vehicles approaching Gladstone Street is recommended for improved clarity/warning as several vehicles were recorded making the movements.

Safe Routes to School and Pedestrian Access

Cranston Street to the east is classified by the State of Rhode Island Highway Functional Classification as a minor arterial road and provides a sidewalk on both sides within the vicinity of the site. Laurel Hill Avenue is classified as a major collector and provides non-continuous sidewalks on both sides of the street. Gladstone Street, Lawrence Street, and Elwyn Street provide a continuous sidewalk on their south sides between Cranston Street and Laurel Hill Avenue. Oxford Street and Asia Street do not provide dedicated sidewalks.

The current layout of the school provides a sidewalk to/from the main access point at Browne Street, Gladstone Street, & Lawrence Street as well as to/from the pedestrian gate at Elwyn Street.

The proposed site plan depicts a new sidewalk to/from the pedestrian gate on Elwyn Street. The existing sidewalk to the north will be removed and a new sidewalk placed to/from Lawrence Street along around the north side of the bus loop.

The traffic counts at the school noted a mix of 8 buses during school arrival and school dismissal (8 buses during each period). The new layout of the site includes a bus drop-off/pick-up loop that can fit 10 large buses adjacent to sidewalk simultaneously. RIPTA bus route 30 travels along Cranston Street and has stops at the pedestrian crossing approximately 100 feet north of Asia Street as well as over 200 feet north of Gladstone Street. RIPTA bus route 18 travels along Laurel Hill Avenue has a northbound stop adjacent to Elwyn Street and southbound stop near Gladstone Street and near Gladstone Street.

As discussed previously, a school crossing guard stationed at the intersection of Browne Street, Gladstone Street, and Lawrence Street typically blocks/stops vehicular movement to/from Lawrence Street during arrival and dismissal peaks with two lines of eastbound arriving vehicles parking within Lawrence Street's travel lanes. Some vehicles were observed reversing (facing eastbound, travelling westbound) back into Lawrence Street's intersection with Laurel Hill Avenue and, when possible, turning around (by reversing) on Lawrence Street. These occurrences can affect pedestrian crossings at Laurel Hill Avenue and pedestrian travel along Lawrence Street. CE&C recommends discontinuing this practice and since a dedicated on-site drop-off/pick-up location will be provided, this interaction will no longer occur.

COMMONWEALTH

Conclusions

The following conclusions and recommendations were made:

- The reconstruction will include a new and relocated building, changes to access to the site, increased on-site parking and improved circulation, and an increase in available student enrollment capacity.
- The proposed school at maximum enrollment is expected to generate 1,816 daily trips during a typical weekday, with 600 trips (324 in, 276 out) during the AM peak hour and 360 trips (166 in, 194 out) during the school afternoon dismissal peak hour. This is approximately 45% more trips than the existing school enrolment capacity.
- Traffic impacts from the school within the adjacent neighborhood is expected to be drastically reduced with the proposed site changes even with the increase in students due to the addition of off-street queue storage. A crossing guard at the main entrance of the school currently stops traffic on Lawrence Street and parents and students get in/out of those parked vehicles. The new drop-off/pick-up will provide a safe, faster and orderly flow of vehicles.
- Repurposing the existing on-site private street will allow indirect access to the school via Cranston Street. The eastbound Gladstone Street approach to Cranston Street is projected to operate at LOS D and E during the school peak hours. All other study intersections are projected to operate at LOS C or better during the school peak hours.
- The school is proposed to provide 100 parking spaces (an increase by 47%) as well as the drop-off/pick-up zone which will reduce the demand for parking during arrival/dismissal times. The school could potentially allow parking within the bus loop during night events.
- It is recommended that the city consider the potential to make Gladstone Street 1-way at all times between Browne Street and Cranston Street (currently westbound entry from Cranston Street is restricted during specified hours). This will allow non-school vehicles to bypass potentially queued school vehicles as well as potentially allow parking outside of school hours (parking is currently restricted).
- School buses will be routed through a proposed loop that can fit 10 large buses adjacent to sidewalk simultaneously. Buses currently route through the existing private street on-site that does not have a sidewalk.

ATTACHMENT C: TRIP GENERATION CALCULATIONS

Elementary School (520)

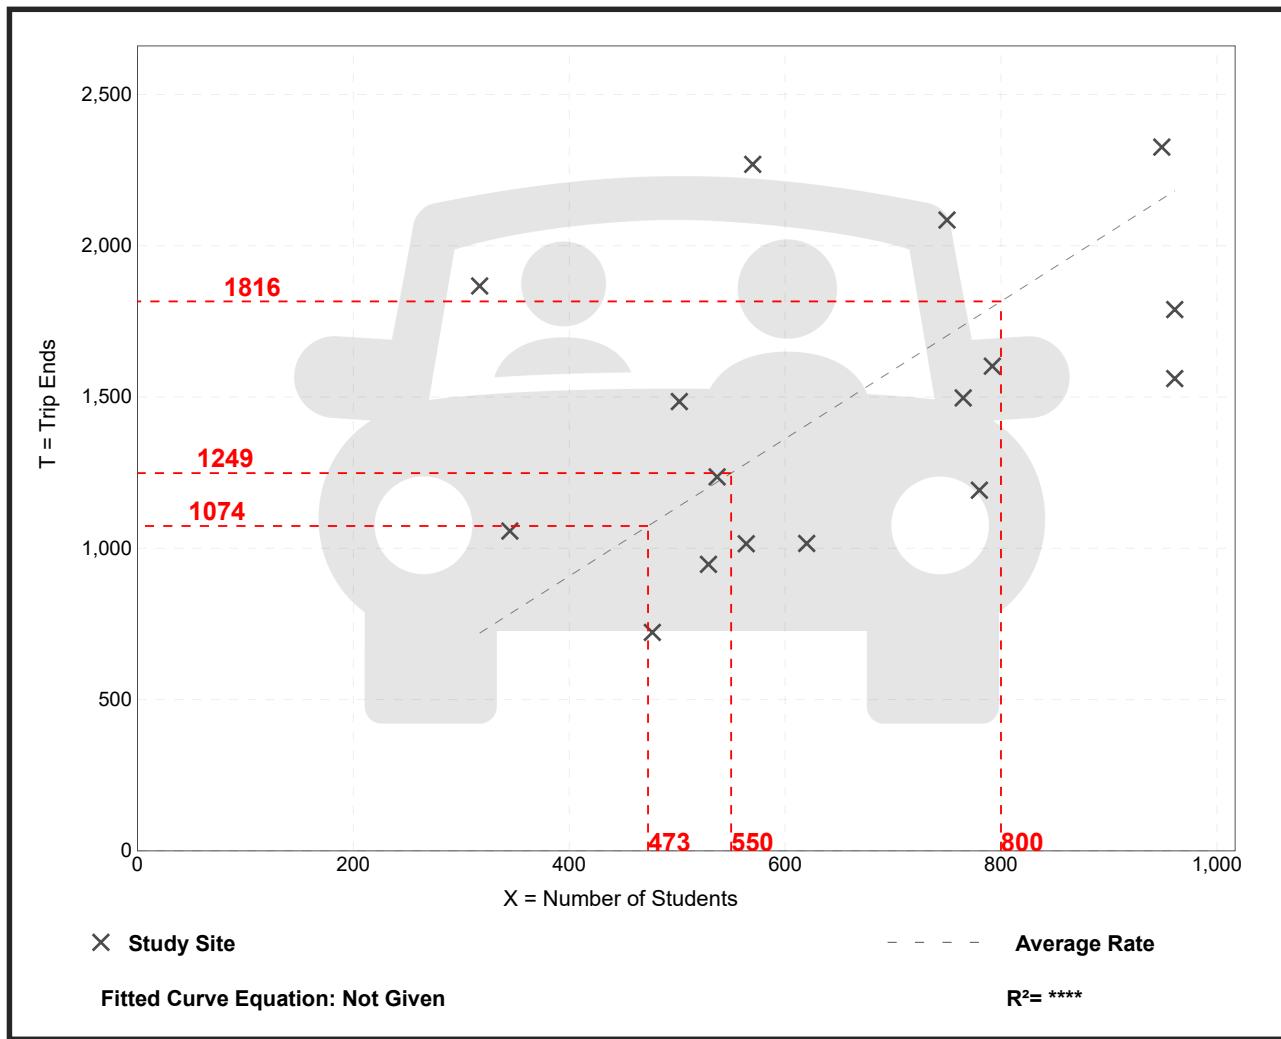

Vehicle Trip Ends vs: Students
On a: Weekday

Setting/Location: General Urban/Suburban
Number of Studies: 16
Avg. Num. of Students: 651
Directional Distribution: 50% entering, 50% exiting

Vehicle Trip Generation per Student

Average Rate	Range of Rates	Standard Deviation
2.27	1.51 - 5.89	0.93

Data Plot and Equation

Elementary School (520)

Vehicle Trip Ends vs: Students
On a: Weekday,
AM Peak Hour of Generator

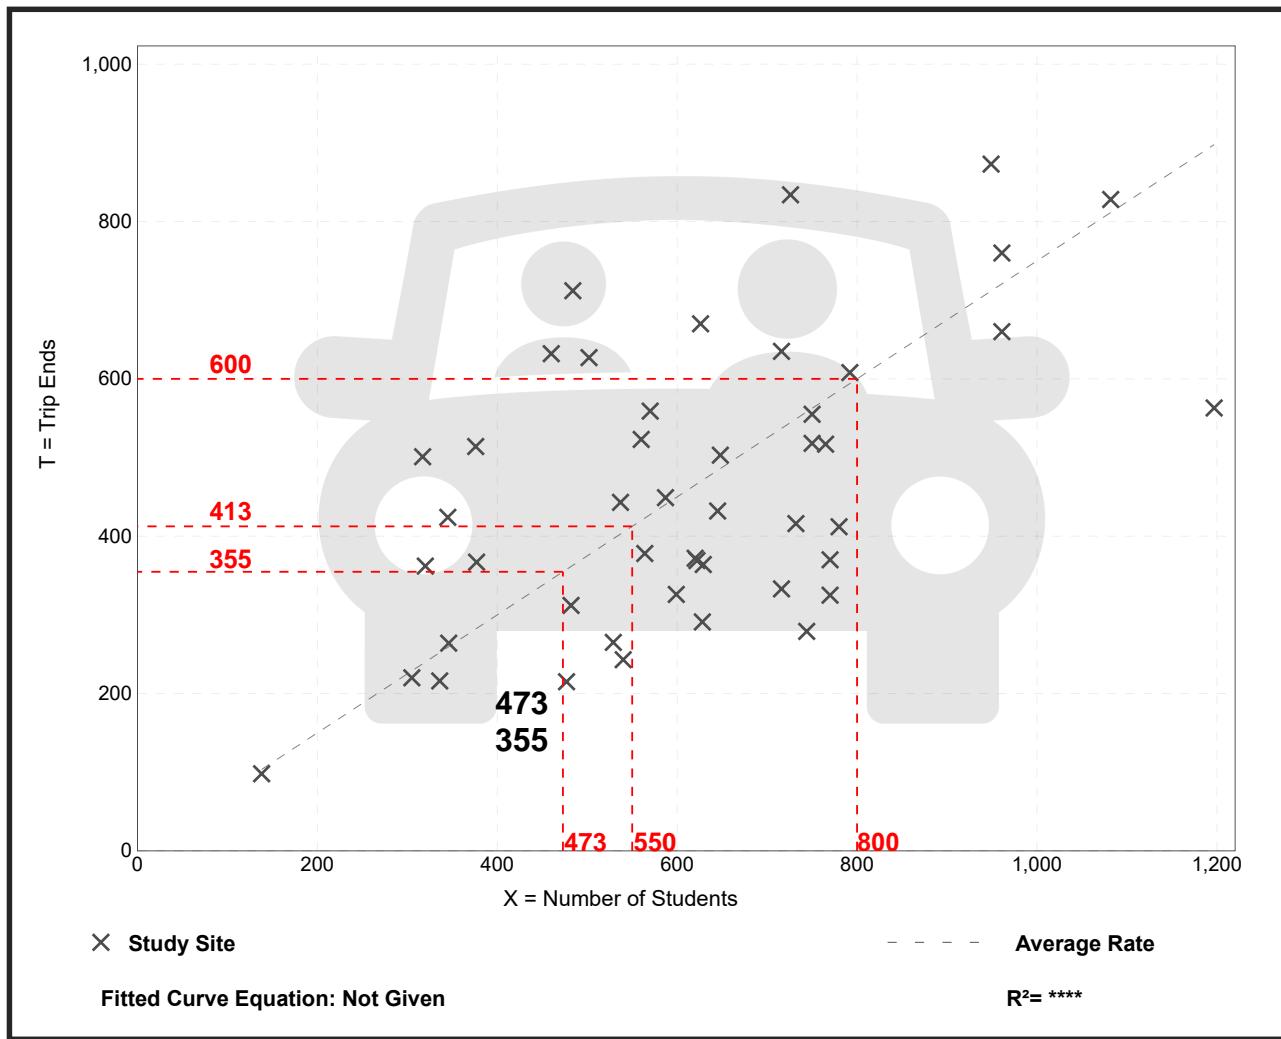

Setting/Location: General Urban/Suburban

Number of Studies: 46
 Avg. Num. of Students: 616
 Directional Distribution: 54% entering, 46% exiting

Vehicle Trip Generation per Student

Average Rate	Range of Rates	Standard Deviation
0.75	0.38 - 1.58	0.27

Data Plot and Equation

Number of Students	Total Trips	In	Out
473	355	192	163
550	413	223	190
800	600	324	276

Elementary School (520)

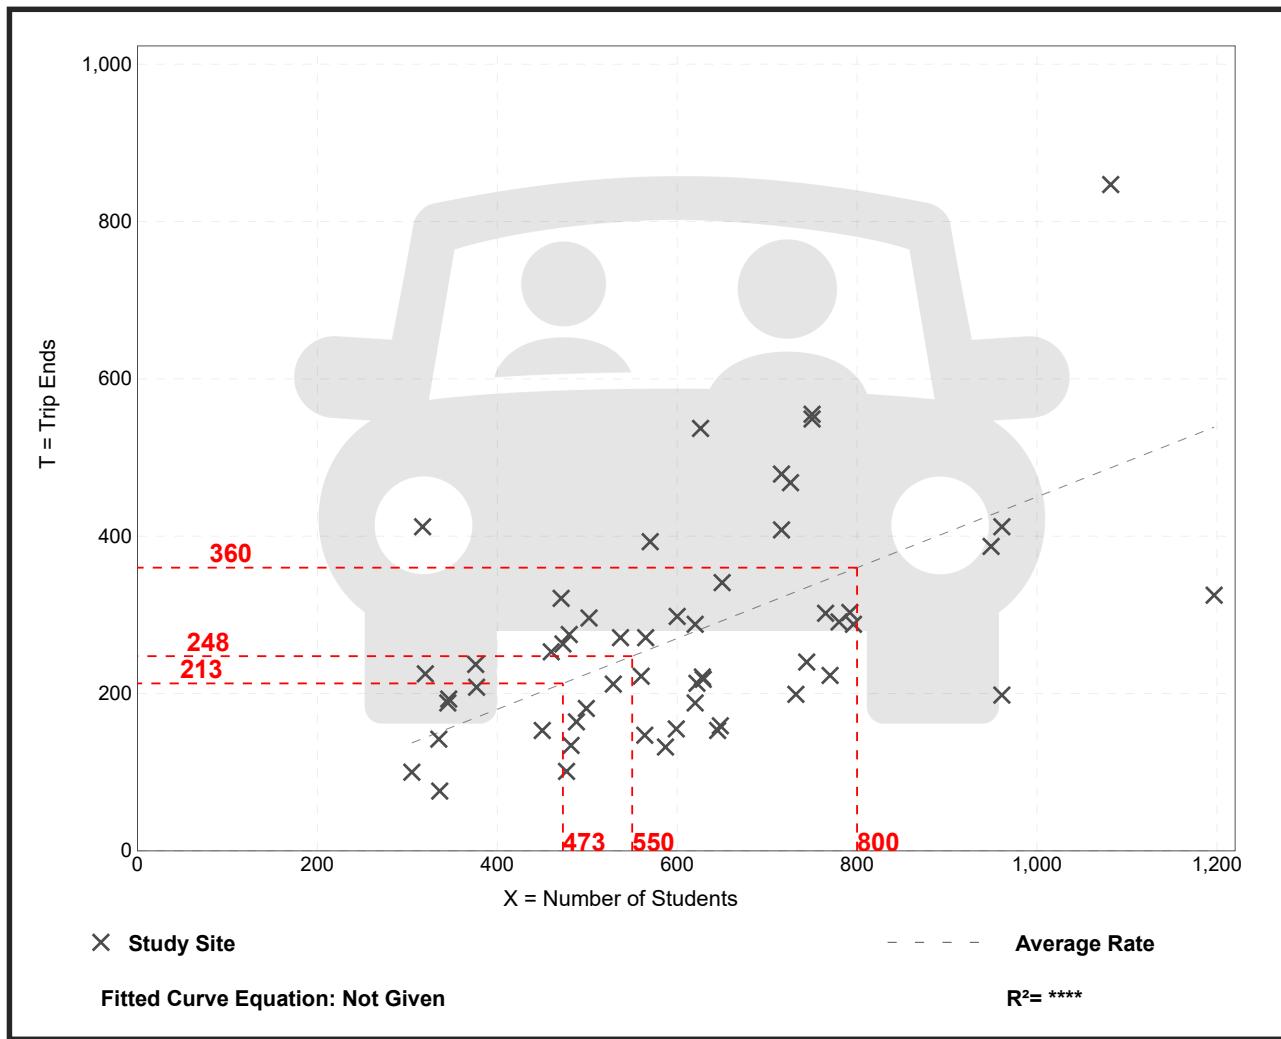

Vehicle Trip Ends vs: Students
On a: Weekday,
PM Peak Hour of Generator

Setting/Location: General Urban/Suburban
 Number of Studies: 54
 Avg. Num. of Students: 608
 Directional Distribution: 46% entering, 54% exiting

Vehicle Trip Generation per Student

Average Rate	Range of Rates	Standard Deviation
0.45	0.21 - 1.30	0.19
