## **EXECUTIVE SUMMARY**

---

### **DESCRIPTION OF PROJECT**

Vanasse & Associates, Inc. (VAI) has prepared this Traffic Impact and Access Study (TIAS) to identify traffic impacts associated with a proposed mixed-use development to be located at 1381 Cranston Street in Cranston, Rhode Island (the “Project”). The purpose of this TIAS is to review existing and future traffic conditions in the vicinity of the site, determine the traffic impact of the proposed Project at key intersections expected to experience increased traffic levels from the Project, and review the need for improvements to mitigate the Project’s traffic impact.

### **PROPOSED PROJECT**

The site is bounded by commercial properties and areas of open space to the north, Cranston Street to the south, residential properties and Dyer Avenue to the east, and industrial properties to the west. Currently, the site contains a number of vacant buildings with various commercial uses. The site currently has one curb cut onto Cranston Street. The Project entails renovating the existing structures on-site to accommodate 99,920 square feet (sf) of self-storage and 129 multifamily residential units and entails a new construction of 57,000 sf of cold storage. The site will provide 270 parking spaces. Site access will be provided via three curb cuts, the existing curb cut onto Cranston Street and two new curb cuts onto Dyer Avenue.

### **EXISTING CONDITIONS**

A comprehensive field inventory was conducted to collect existing roadway geometrics, traffic volumes, operating characteristics, speed limits, and sight distances, as well as land use information. Traffic volumes were collected in January 2023 at the intersections expected to receive the traffic impact from the Project. These are listed below:

- Dyer Avenue at Puritan Avenue
- Dyer Avenue at Governor Street
- Dyer Avenue at Cranston Street
- Cranston Street at the Project site driveway
- Cranston Street at Haven Avenue

## **FUTURE CONDITIONS**

Traffic volumes within the study area were projected to 2028, which reflects a five-year planning horizon consistent with industry traffic study guidelines as well as the Cranston City Plan Commission Policy for Traffic. These conditions incorporate traffic growth due to general background traffic increases as well as development projects currently being proposed/permited or under construction and expected to generate traffic in the future. This condition is referred to as the No-Build condition.

## **PROJECT-GENERATED TRAFFIC**

The Project is expected to generate 838 vehicle trips on an average weekday (two-way, 24-hour volume), with 63 vehicle trips expected during the weekday morning peak hour and 73 vehicle trips expected during the weekday evening peak hour. This is a reduction from the previous use on-site, which was estimated to generate approximately 304, 110, and 80 vehicle trips during the same respective time periods.

Project-related traffic-volume increases external to the study area relative to 2028 No-Build conditions are anticipated to range from 5 to 28 vehicles or 0.5 to 2.9 percent during the peak periods.

## **TRAFFIC OPERATIONS ANALYSIS**

In future conditions, operations are generally preserved with minor increases to delay and vehicle queue lengths on the various approaches.

## **RECOMMENDATIONS**

Access to the Project site will be provided via the one existing driveway onto Cranston Street and the two new driveways onto Dyer Avenue. The following recommendations are offered with respect to the promotion of alternative transportation and also to the design and operation of the Project site driveways:

- Public transit facilities and schedules for the transit services in the area should be posted in central gathering areas to encourage the use of transit by the project residents.
- The driveways should be placed under STOP-sign (*Manual on Uniform Traffic Control Devices* (MUTCD)<sup>1</sup> R1-1) control, with a painted STOP-bar included.
- All signs and other pavement markings to be installed within the Project site shall conform to the applicable standards of the current MUTCD.
- Signs and landscaping adjacent to the Project site driveways should be designed and maintained so as not to restrict lines of sight.

---

<sup>1</sup>*Manual on Uniform Traffic Control Devices* (MUTCD); Federal Highway Administration; Washington, D.C.; 2009.

- Snow windrows within sight triangle areas of the Project site driveway should be promptly removed where such accumulations would impede sightlines.

## **CONCLUSIONS**

As documented in this study, Project-related traffic increases will not result in significant increases on overall traffic volumes or traffic delays within the study area. The site driveways will provide efficient access to and from the development. In general, the Project represents a decrease in traffic generation associated with the site as compared with the previous use. However, Project-related traffic can be adequately accommodated within the existing infrastructure with minimal impact on the traffic operations within the study area.

## **INTRODUCTION**

---

Vanasse & Associates, Inc. (VAI) has prepared this Traffic Impact and Access Study (TIAS) in order to identify the traffic impacts associated with the proposed mixed-use development to be located at 1381 Cranston Street, in Cranston, Rhode Island. This report identifies and analyzes existing and future traffic conditions both with and without the Project and reviews access requirements, potential offsite improvements, and safety considerations.

### **STUDY METHODOLOGY**

This study was prepared in accordance with the State guidelines for TIASs as well as the Cranston City Plan Commission Policy for Traffic and was conducted in three distinct stages.

The first stage involved an assessment of existing conditions in the study area and included an inventory of roadway geometry, observations of traffic flow, and collection of peak-period traffic counts.

In the second stage of the study, future traffic conditions were projected and analyzed. Specific travel demand forecasts for the Project were assessed along with future traffic demands due to expected traffic growth independent of the Project. A five-year time horizon was selected for these analyses consistent with industry guidelines for the preparation of this TIAS as well as the Cranston City Plan Commission Policy for Traffic. The traffic analysis conducted in stage two identifies projected future roadway capacity, traffic safety, and site access issues.

The third stage of the study presents and evaluates measures to address traffic and safety issues, if any are necessary, based on the results from stage two of the study.

## **EXISTING CONDITIONS**

---

A comprehensive field inventory of existing conditions within the study area was conducted in January 2023. The field investigation consisted of an inventory of existing roadway geometrics; traffic volumes; and operating characteristics; as well as posted speed limits, sight distance, and land use information within the study area. The study area for the Project contains the major roadways which provide access to the Project, as well as the intersections which are expected to accommodate the majority of Project-related traffic. The study area is listed below and graphically depicted in Figure 1.

- Dyer Avenue at Puritan Avenue
- Dyer Avenue at Governor Street
- Dyer Avenue at Cranston Street
- Cranston Street at the Project site driveway
- Cranston Street at Haven Avenue

The following describes the study area roadways which provide access/egress to the Project.

## **GEOMETRY**

### **Roadways**

#### **Dyer Avenue**

Dyer Avenue is classified as an urban minor arterial roadway under City jurisdiction. Dyer Avenue runs in a general north-to-south alignment throughout the study area. Dyer Avenue provides one general-purpose travel lane in each direction separated by a double-yellow centerline with exclusive turn lanes provided at some intersections. Land uses along Dyer Avenue, throughout the study area, generally consist of commercial and residential uses.

#### **Cranston Street**

Cranston Street is classified as an urban minor arterial roadway under City jurisdiction. Cranston Street runs in a general east-to-west alignment throughout the study area. Cranston Street provides one general-purpose travel lane in each direction separated by a double-yellow centerline.

Legend:

Study Area Intersections

Figure 1

Site Location and  
Study Area Map

Land uses along Cranston Street, throughout the study area, generally consist of commercial, industrial, and residential uses.

### **Intersections**

Figure 2 summarizes existing lane use, travel lane widths, and sidewalk and crosswalk locations at the study area intersections.

### **EXISTING TRAFFIC VOLUMES**

In order to establish base traffic-volume demands and flow patterns within the study area, manual turning movement counts (TMCs) were completed in January 2023. The TMCs were conducted during the weekday morning (7:00 to 9:00 AM) and weekday evening (3:00 to 6:00 PM) peak periods. Bicycles and pedestrians were also counted. In addition, an automatic traffic recorder count (ATR) was conducted in January 2023 on Cranston Street west of Dyer Avenue for 48 hours.

### **Traffic-Volume Adjustments**

In order to develop 2023 Existing traffic-volume conditions, adjustments were made to account for seasonal fluctuations in traffic. The Rhode Island Department of Transportation (RIDOT) has permanent count stations that are used to find the adjustments needed for traffic volumes to account for seasonal fluctuations. Based on the data provided by RIDOT for a Tuesday in January, it was determined that the traffic volumes on a roadway classified as “other highways urban” are approximately 8 percent lower than average-month conditions for the nearest count station. Therefore, traffic volumes were adjusted upwards by 8 percent to average-month conditions. The 2023 Existing traffic volumes on Cranston Street are summarized in Table 1.

As can be seen in Table 1, Cranston Street was found to accommodate approximately 11,516 vehicles per day (vpd) with 964 vehicles per hour (vph) during the weekday morning peak hour and 899 vph during the weekday evening peak hour. During the weekday morning peak hour, 54 percent of the traffic is traveling westbound. During the weekday evening peak hour, 56 percent of the traffic is traveling westbound. The Existing weekday morning and weekday evening peak-hour traffic volumes for the study area intersections are graphically depicted in Figure 3 and Figure 4, respectively.

**Table 1**  
**2023 EXISTING ROADWAY TRAFFIC-VOLUME SUMMARY**

Location	Weekday	Weekday Morning Peak Hour			Weekday Evening Peak Hour		
	Daily Volume (vpd) <sup>a</sup>	Volume (vph) <sup>b</sup>	Percent of Daily Traffic <sup>c</sup>	Predominant Flow	Volume (vph)	Percent of Daily Traffic	Predominant Flow
Cranston Street, west of Dyer Avenue	11,516	964	8.5	54% WB	899	7.9	56% WB

Note: Includes seasonal correction factors applied to ATR and TMCs that were conducted in January 2023.

<sup>a</sup>Two-way daily traffic expressed in vehicles per day.

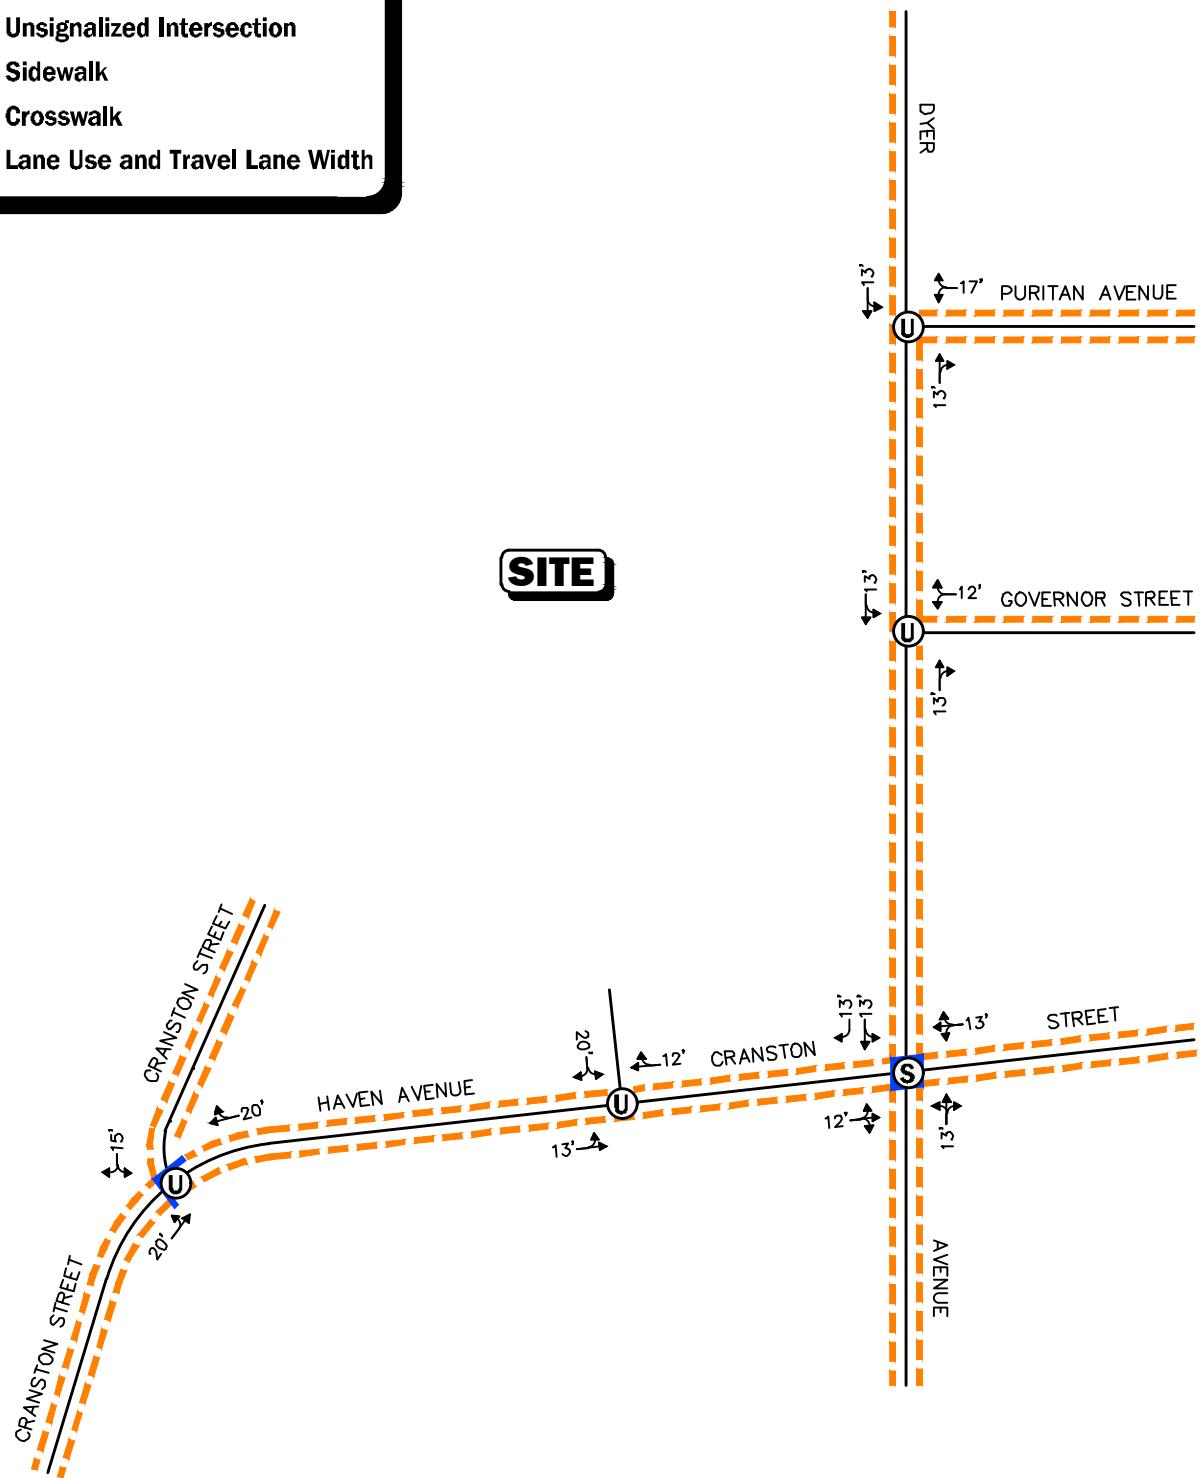

<sup>b</sup>Two-way peak-hour volume expressed in vehicles per hour.

<sup>c</sup>The percent of daily traffic that occurs during the peak hour.

WB = westbound.

## **PEDESTRIAN AND BICYCLE FACILITIES**

A comprehensive field inventory of pedestrian and bicycle facilities within the study area was undertaken in January 2023. The field inventory consisted of a review of the location of sidewalks and pedestrian crossing locations along the study area roadways and at the study area intersections, as well as the location of bicycle facilities. Sidewalks are provided along both sides of Cranston Street, both sides of Haven Avenue, both sides of Puritan Avenue, both sides of Dyer Avenue south of Puritan Avenue, on the west side of Dyer Avenue north of Puritan Avenue, and on the north side of Governor Street. Crosswalks are provided across all legs of the intersection of Cranston Street at Dyer Street and across both Cranston Street legs to the intersection of Cranston Street with Haven Avenue.

## **PUBLIC TRANSPORTATION**

Public transportation services are provided within the study area by the Rhode Island Public Transit Authority (RIPTA) for shuttle services. Table 2 summarizes the characteristics of this service. Schedule and fare information for the shuttle service is provided in the Appendix.

**Table 2**  
**PUBLIC TRANSPORTATION SERVICES**

Service	Stop Closest to Site	Distance from Site	Weekday	
			Hours of Operation	Headway (minutes)
Dyer/Pocasset Bus Line	Cranston at Dyer	~ 60 feet west	5:55 AM – 10:29 PM	30-40
Arlington/Oaklawn Bus Line	Cranston Before Dyer	~ 180 feet west	5:03 AM – 9:58 PM	40-50

## **MOTOR VEHICLE CRASH DATA**

Motor vehicle crash information for the study area intersections was provided by the Cranston Police Department for the most recent three-year period available (2020 through 2022) in order to examine motor vehicle crash trends occurring within the study area. The data is summarized in Table 3 by intersection, type, weather condition, lighting condition, pavement condition, and severity.

As can be seen in Table 3, most of the study area intersections were found to have experienced 5 or fewer reported motor vehicle crashes over the three-year review period, averaging 1.67 crashes per year or less. The majority of the accidents were angle of rear-end collisions, occurred on dry pavement, during the daylight, in clear weather, and caused property damage only. The intersection of Dyer Avenue at Cranston Street experienced 33 accidents over the three-year review period, averaging 11 accidents per year. The majority of the accidents were angle collisions (18 out of 33), occurred on dry pavement (30 out of 33), during daylight (25 out of 33), in clear weather (26 out of 33), and caused property damage only (31 out of 33). No fatalities were reported over the three-year period reviewed.

<sup>a</sup>Average number of crashes over three-year period.

## **VEHICLE SPEEDS**

Vehicle speeds along Cranston Street west of Dyer Avenue were recorded to determine the average and 85<sup>th</sup> percentile vehicle speeds. The statutory speed limit pursuant to R.I.G.L c. 31 § 14-2 on Cranston Street is 25 miles per hour (mph)<sup>2</sup> in the vicinity of the site. The results of the speed measurements are shown in Table 4.

As can be seen from Table 4, the average speed recorded eastbound on Cranston Street was 21 mph and the 85<sup>th</sup> percentile speed recorded was 27 mph. The average speed recorded westbound was 27 mph and the 85<sup>th</sup> percentile speed was 31 mph.

**Table 4**  
**OBSERVED VEHICLE SPEEDS – (In Miles Per Hour)**

Location/Direction	Average Speed	85 <sup>th</sup> Percentile Speed <sup>a</sup>
<i>Cranston Street, west of Dyer Avenue:</i>		
Eastbound	21	27
Westbound	27	31

<sup>a</sup>The 85<sup>th</sup> percentile speed is the speed at which 85 percent of the traffic is traveling at or below. It is commonly used for setting speed limits on roadways.

---

<sup>2</sup>The statutory or “prima facie” speed is defined in R.I.G.L Chapter 31, Section 14-2, as the speed which would be deemed reasonable and proper to operate a motor vehicle.

## **FUTURE CONDITIONS**

---

To determine the impact of site-generated traffic volumes on the roadway network under future conditions, Existing traffic volumes in the study area were projected to the year 2028. Traffic volumes on the roadway network at that time, in the absence of the Project (that is, the No-Build condition), would include existing traffic, new traffic due to general background traffic growth, and traffic related to specific developments by others expected to be completed by 2028. Inclusion of these factors resulted in the development of 2028 No-Build traffic volumes. Anticipated site-generated traffic volumes were then superimposed upon these No-Build traffic-flow networks to develop the 2028 Build traffic-volume conditions.

## **FUTURE TRAFFIC GROWTH**

Traffic growth on area roadways is a function of the expected land developments impacting the study area. Several methods are used to estimate this growth. A procedure frequently employed estimates an annual percentage increase in traffic growth and applies that percentage to all existing traffic volumes under study. The drawback to such a procedure is that some turning volumes may actually grow at either a higher or a lower rate at particular intersections.

In addition, we identified the location and type of planned development affecting the study area, estimated the traffic to be generated by that development, and assigned it to the area roadway network. This produces a more realistic estimate of growth for local traffic. However, the drawback of this procedure is that the potential growth in population and development external to the study area would not be accounted for in the traffic projections.

To provide a conservative analysis framework, both procedures were used in this TIAS.

### **General Background Growth**

Based on a review of data from RIDOT and other area traffic studies, it was determined that the traffic volumes are increasing in the area by approximately 0.76 percent per year on average. Therefore, a 1.0 percent per year compounded annual background traffic growth rate was used to account for future traffic growth including presently unforeseen development within the study area.

### **Specific Development by Others**

The City of Cranston was contacted in order to determine if there are any planned or approved development projects that are expected to influence future traffic volumes within the study area. Based on these discussions, the following project was identified for possible inclusion in this assessment:

***Knights Corner*** – This project entails construction of a mixed-use development including residential and restaurant uses. A detailed traffic analysis has not yet been submitted for this development, but based on the number of residential units and the size of the restaurant and existing trip distributions, the trips generated for this background development were included in the future conditions analysis. Knights Corner will be located at 1388 and 1390 Cranston Street, south of the Project.

### **Planned Roadway Improvements**

The City of Cranston was contacted in order to determine if there are any planned roadway improvement projects expected to be completed within the study area in the five-year planning horizon. Based on these discussions, no roadway improvement projects are planned within the study area beyond general maintenance.

### **Previous Site Trip Generation**

The site was previously occupied by the Cranston PrintWorks facility with a substantial employee base on site. The site could be re-occupied by an industrial operation; therefore, trips for this use were calculated for inclusion in the No Build condition. Trips for the previous use on-site were calculated based on the Institute of Transportation Engineers (ITE) Trip Generation Manual<sup>3</sup> using Land Use Code (LUC) 110, *General Light Industrial*. Table 5 provides a summary of the previous site trip generation.

**Table 5**  
**PREVIOUS SITE TRIP-GENERATION SUMMARY**

Time Period	Industrial Trips <sup>a</sup>
Weekday Daily	1,142
<i>Weekday Morning Peak Hour:</i>	
Entering	152
Exiting	21
Total	173
<i>Weekday Evening Peak Hour:</i>	
Entering	21
Exiting	131
Total	152

<sup>a</sup>Based on ITE LUC 110, *General Light Industrial*; 234,352 sf.

<sup>3</sup>Trip Generation, 11<sup>th</sup> Edition; Institute of Transportation Engineers; Washington, DC; 2021.

As can be seen in Table 5, the previous site would be expected to generate 1,142 vehicle trips on an average weekday (two-way, 24-hour volume), with 173 vehicle trips (152 entering and 21 exiting) expected during the weekday morning peak hour and 152 vehicle trips (21 entering and 131 exiting) expected during the weekday evening peak hour.

Since the site could be reoccupied with a similar industrial type use, the trips shown in Table 5 were assigned to the No-Build traffic-volume condition.

### **No-Build Traffic Volumes**

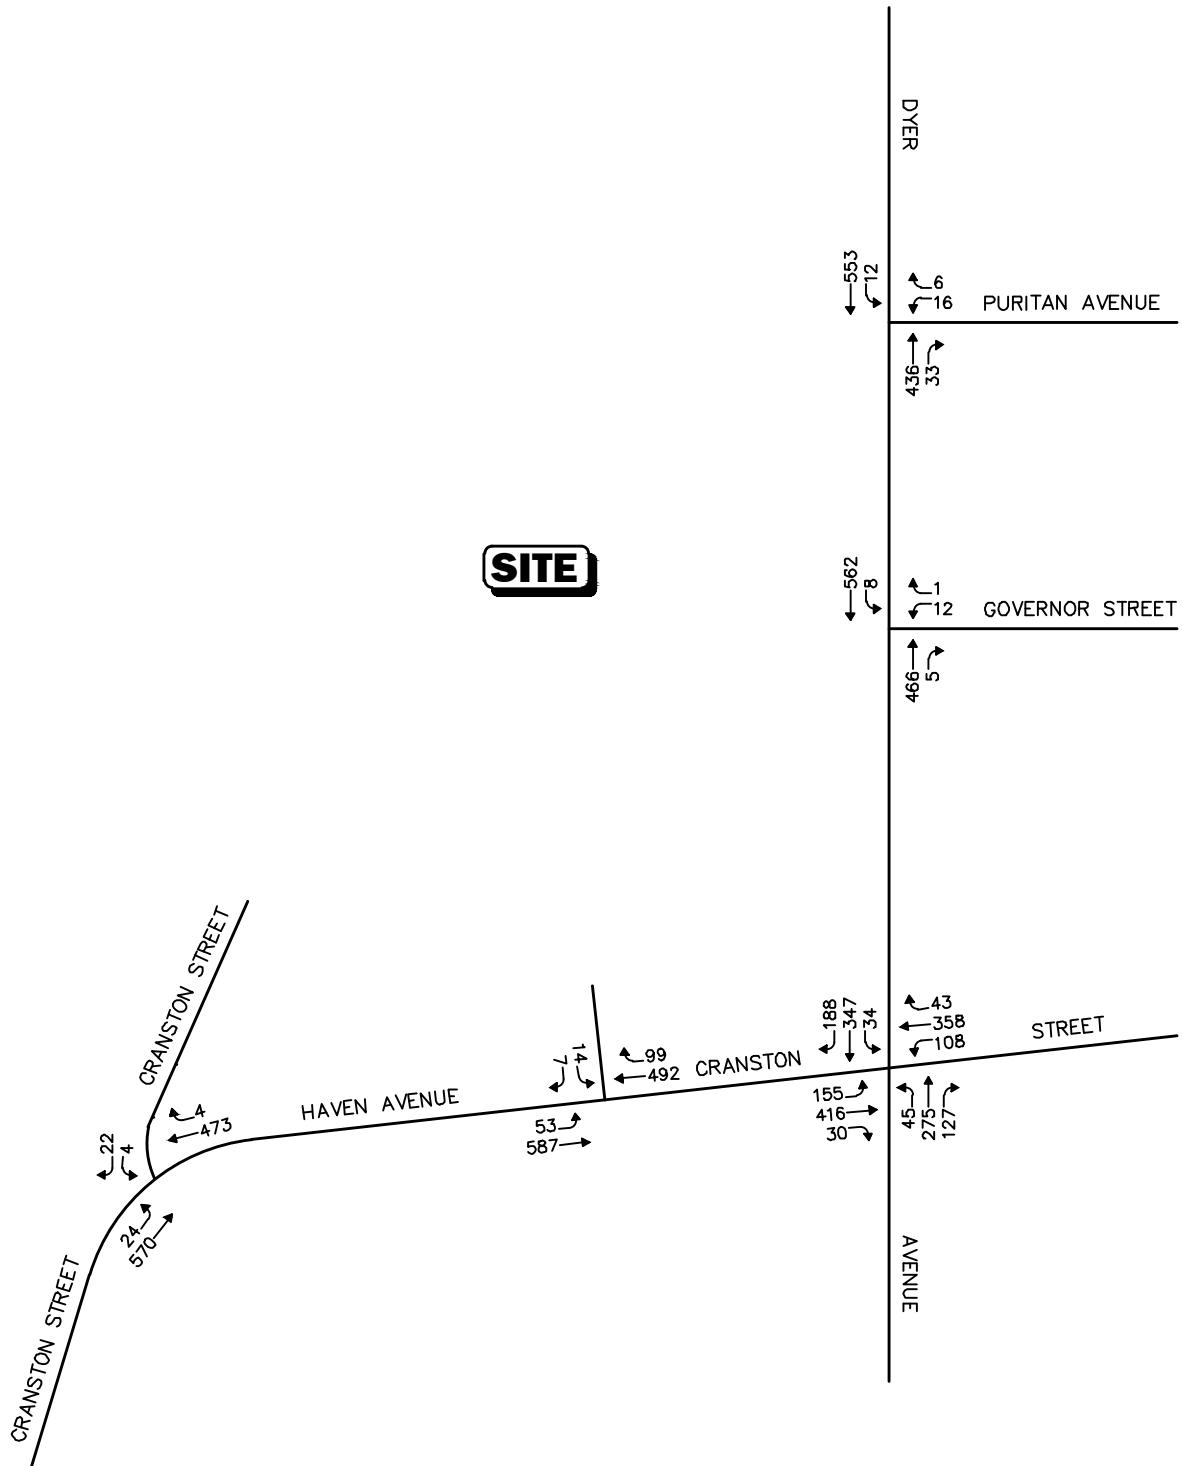

The 2028 No-Build peak-hour traffic-volume networks were developed by applying the 1.0 percent per year compounded annual background traffic growth rate to the 2023 Existing peak-hour traffic volumes and incorporating traffic projections from the Knights Corner and the previous site were it to be reoccupied. The resulting 2028 No-Build weekday morning and evening peak-hour traffic-volume networks are shown on Figure 5 and Figure 6, respectively.

### **PROJECT-GENERATED TRAFFIC**

Vehicle trips from the Project were developed using trip-generation estimates with distribution onto the study area locations. The trip generation was prepared using data from the ITE *Trip Generation* manual, which is the standard source for trip-generation estimates and is required by the Cranston City Plan Commission Policy for Traffic.

### **Proposed Site Trips**

The Project entails renovating the existing structures on-site to accommodate 99,920 sf of self-storage, 129 multifamily residential units, and entails a new construction of 57,000 sf of cold storage. In order to develop the traffic characteristics of the proposed Project, trip-generation statistics published by the ITE for LUC 151, *Mini-Warehouse*, LUC 157, *High-Cub Cold Storage Warehouse*, and LUC 221, *Multifamily Housing (Mid-Rise)* were used. Table 6 provides a summary of the proposed Project trip generation.

Note: Imbalances exist due to numerous curb cuts and side streets that are not shown.

**Table 6**  
**PROPOSED SITE TRIP-GENERATION SUMMARY**

Time Period/ Directional Distribution	Self-Storage Trips <sup>a</sup>	Cold-Storage Trips <sup>b</sup>	Multifamily Residential Trips <sup>c</sup>	Total Trips
Weekday Daily	156	96	586	838
<i>Weekday Morning Peak-Hour:</i>				
Entering	6	3	11	20
<u>Exiting</u>	<u>4</u>	<u>2</u>	<u>37</u>	<u>43</u>
Total	10	5	48	63
<i>Weekday Evening Peak-Hour:</i>				
Entering	8	2	31	41
<u>Exiting</u>	<u>8</u>	<u>3</u>	<u>20</u>	<u>31</u>
Total	16	5	51	72

<sup>a</sup>Based on ITE LUC 151, *Mini-Warehouse*; 106,920 sf.

<sup>b</sup>Based on ITE LUC 157, *High-Cube Cold Storage Warehouse*; 45,200 sf.

<sup>c</sup>Based on ITE LUC 221, *Multifamily Housing (Mid-Rise)*; 129 units.

As can be seen in Table 6, the Project is expected to generate 838 vehicle trips on an average weekday (two-way, 24-hour volume), with 63 vehicle trips (20 entering and 43 exiting) expected during the weekday morning peak hour and 72 vehicle trips (41 entering and 31 exiting) expected during the weekday evening peak hour.

#### **Previous To Proposed Use Comparison**

A comparison of the previous site trip generation and the proposed site trips was conducted using the ITE data. Table 7 summarizes the net change in trip generation associated with the proposed Project.

As shown in Table 7, the Project is anticipated to generate 304 less daily trips (24-hour total, entering and exiting) on an average weekday than the previous site use. During the weekday morning peak hour, the Project is expected to generate 110 less trips (132 less entering and 22 more exiting) than the previous site use and during the weekday evening peak hour, the Project is expected to generate 80 less trips (20 more entering and 100 less exiting) than the previous site use. These previous site trips were removed from the No Build traffic volume conditions and replaced with the Project traffic generation for the Build analysis.

**Table 7**  
**ITE TRIP-GENERATION COMPARISON**

Time Period	Proposed Site Trips <sup>a</sup>	Previous Site Trips <sup>b</sup>	Change
Weekday Daily	838	1,142	-304
<i>Weekday Morning Peak Hour:</i>			
Entering	20	152	-132
<u>Exiting</u>	<u>43</u>	<u>21</u>	<u>22</u>
Total	63	173	-110
<i>Weekday Evening Peak Hour:</i>			
Entering	41	21	20
<u>Exiting</u>	<u>31</u>	<u>131</u>	<u>-100</u>
Total	72	152	-80

<sup>a</sup>From Table 6.

<sup>b</sup>From Table 5.

### **TRIP DISTRIBUTION AND ASSIGNMENT**

The directional distribution of the residential site-generated trips to and from the Project was determined based on a review of existing travel patterns and journey-to-work census data at the study area intersections. The directional distribution of the warehouse site-generated trips to and from the Project was determined based on a review of existing travel patterns at the study area intersections. The trip distributions for the residential and warehouse components of the Project are summarized in Table 8 and graphically depicted on Figures 7 and 8, respectively. The weekday morning and weekday evening peak-hour traffic volumes expected to be generated by the residential and warehouse components of the Project were assigned on the study area roadway network as shown on Figures 9, 10, 11, and 12.

**Table 8**  
**TRIP-DISTRIBUTION SUMMARY**

Roadway	Direction (To/From)	Residential Percent (To/From)	Warehouse Percent (To/From)
Dyer Avenue	North	30	35
Dyer Avenue	South	10	5

## **FUTURE TRAFFIC VOLUMES – BUILD CONDITION**

The 2028 Build condition networks consist of the 2028 No-Build traffic volumes with the anticipated Project-generated traffic added to them. The 2028 Build weekday morning and evening peak-hour traffic-volume networks are graphically depicted on Figure 13 and Figure 14, respectively.

A summary of peak-hour projected traffic-volume increases external to the study area that is the subject of this assessment is shown in Table 9. These volumes are based on the expected increases from the Project.

**Table 9**  
**PEAK-HOUR TRAFFIC-VOLUME CHANGES**

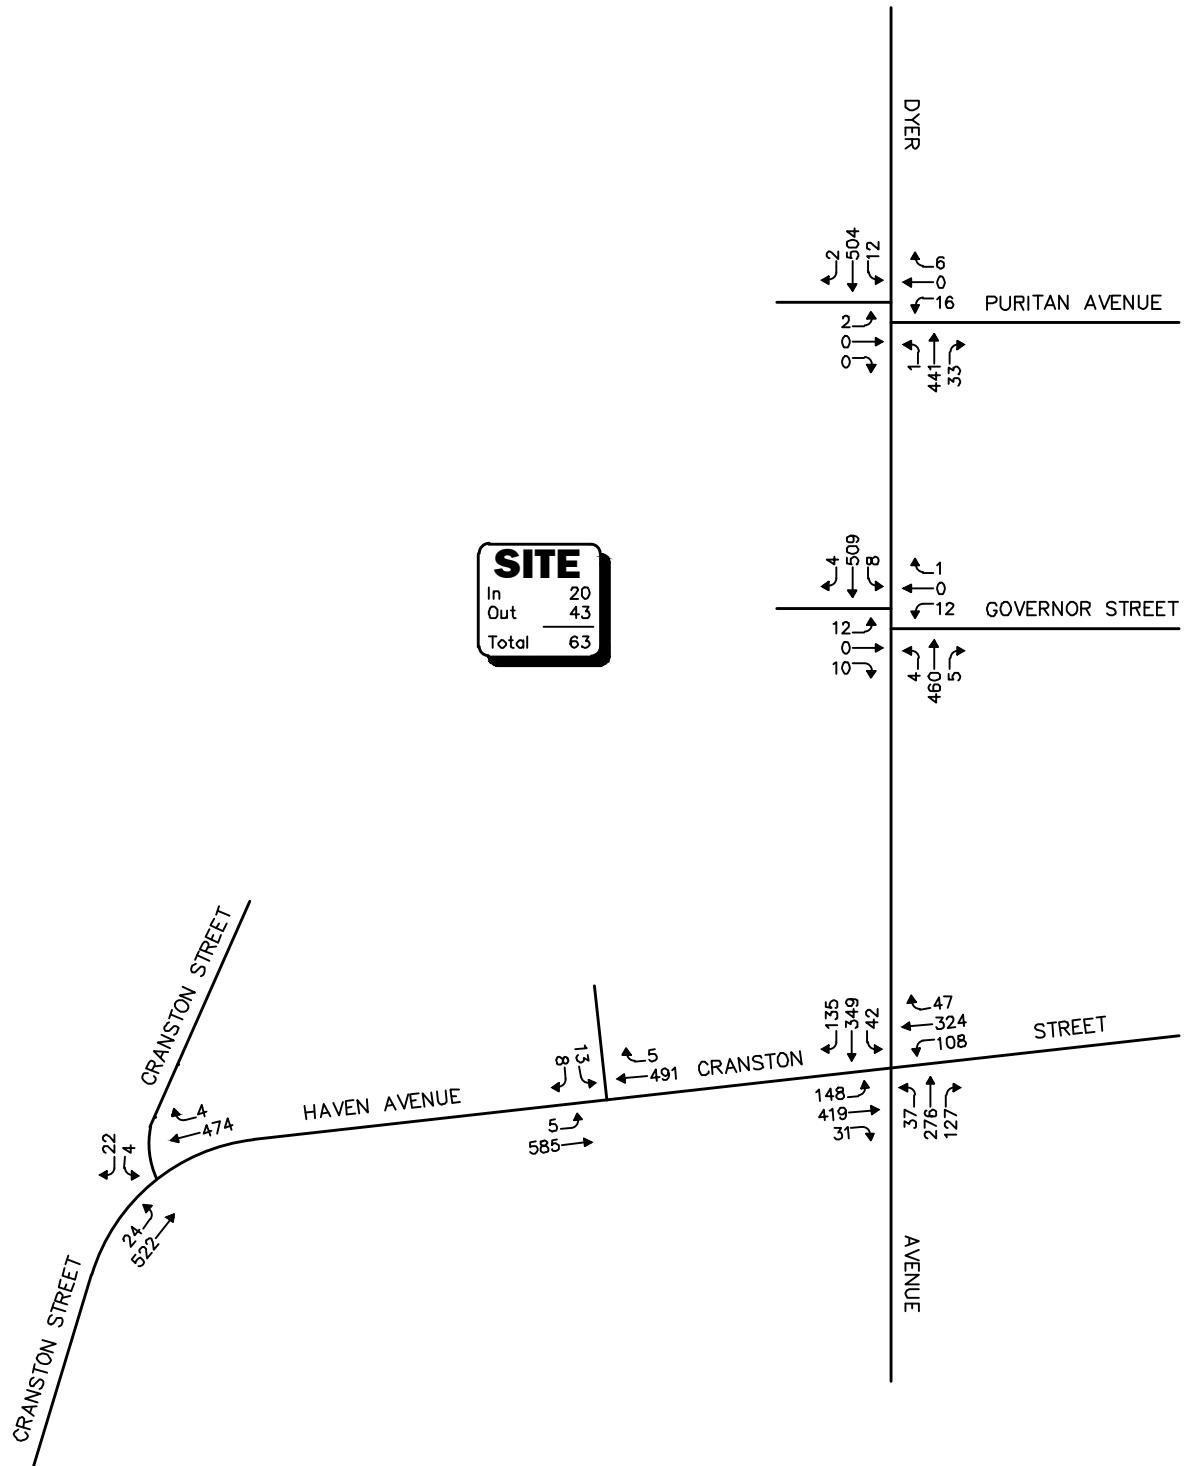

Location/Peak Hour	2028 No-Build	2028 Build	Traffic-Volume Increase/ Decrease Over No-Build	Percent Increase/ Decrease Over No-Build
<i>Dyer Avenue, north of Puritan Avenue:</i>				
Weekday Morning	1,007	967	-40	-4.0
Weekday Evening	1,094	1,064	-30	-2.7
<i>Dyer Avenue, south of Cranston Street:</i>				
Weekday Morning	932	928	-4	-0.4
Weekday Evening	924	920	-4	-0.4
<i>Cranston Street, east of Dyer Avenue:</i>				
Weekday Morning	1,086	1,067	-19	-1.7
Weekday Evening	1,012	1,001	-11	-1.1
<i>Cranston Street, south of Haven Avenue:</i>				
Weekday Morning	1,089	1,042	-47	-4.3
Weekday Evening	985	948	-37	-3.8

As shown in Table 9, Project-related traffic-volume decreases external to the study area relative to 2028 No-Build conditions are anticipated to range from 4 to 47 vehicles or 0.4 to 4.3 percent during the peak periods.

## **PARKING GENERATION**

A review of potential parking demand for the Project was conducted using industry sources. Parking demand was determined by using the ITE *Parking Generation* publication<sup>4</sup> LUC 151, *Mini-Warehouse*, LUC 150, *Warehousing*, and LUC 221, *Multifamily Housing (Mid-Rise)*. Estimates of parking demand for the Project were calculated and are summarized in Table 8.

<sup>4</sup>*Parking Generation*, 5th; Institution of Transportation Engineers; Washington, DC; 2020.

Note: Imbalances exist due to numerous curb cuts and side streets that are not shown.

Not To Scale

Associates inc**

**2028 Build  
Weekday Evening  
Peak-Hour Traffic Volumes**

**Table 10**  
**PROJECT PARKING DEMAND**

Time Period	Uses	Parking Rates		Parking Spaces	
		Average	85 <sup>th</sup> Percentile	Average	85 <sup>th</sup> Percentile
Weekday	Self-Storage <sup>a</sup>	0.10 spaces/sf	0.25 spaces/sf	11	27
	Cold-Storage <sup>b</sup>	0.39 spaces/sf	1.11 spaces/sf	18	50
	Residential <sup>c</sup>	0.75 spaces/bed	0.87 spaces/bed	97	113
<b>Total</b>		--	--	<b>126</b>	<b>190</b>

<sup>a</sup>Based on ITE LUC 151, *Mini-Warehouse*; 106,920 sf.

<sup>b</sup>Based on ITE LUC 150, *Warehousing*; 45,200 sf.

<sup>c</sup>Based on ITE LUC 221, *Multifamily Housing (Mid-Rise)*; 129 units.

As can be seen in Table 10, the 85<sup>th</sup> percentile rate indicates that the site would require 190 spaces to satisfy the expected demand. The Project is proposing 244 parking spaces, which is 54 spaces more than the 85<sup>th</sup> percentile rate indicated would be required. Therefore, the proposed parking supply is sufficient and will accommodate the peak-parking demand of the proposed development with additional spaces to accommodate visitor parking demand.

## **SIGHT DISTANCE EVALUATION**

---

Sight distance measurements were performed at the site driveways intersections with Cranston Street and Dyer Avenue in accordance with American Association of State Highway and Transportation Officials (AASHTO)<sup>5</sup> recommendations. Both stopping sight distance (SSD) and intersection sight distance (ISD) measurements were performed. In brief, SSD is the distance recommended to be provided by a vehicle traveling at the design speed of a roadway, on wet pavement, to stop prior to striking an object in its travel path. ISD is the sight distance recommended to be provided by a driver entering or crossing an intersecting roadway to perceive an on-coming vehicle and safely complete a turning or crossing maneuver with on-coming traffic. *In accordance with AASHTO standards, if the measured ISD is at least equal to the recommended SSD value for the appropriate design speed, the intersection can operate in a safe manner.* Table 10 presents the measured SSD and ISD at the subject intersection.

---

<sup>5</sup>*A Policy on Geometric Design of Highway and Streets*, 7<sup>th</sup> Edition; American Association of State Highway and Transportation Officials (AASHTO); Washington D.C.; 2018.

**Table 11**  
**SIGHT DISTANCE MEASUREMENTS<sup>a</sup>**

Intersection/Sight Distance Measurement	Recommended Distances (Feet)	Field Measured Distances (Feet)
<b>Cranston Street at Project Site Driveway</b>		
<i>Stopping Sight Distance:</i>		
Cranston Street approaching from the east	250	500+
Cranston Street approaching from the west	250	344
<i>Intersection Sight Distance:<sup>b</sup></i>		
Left turn from Site Driveway (looking east)	335	500+
Left turn from Site Driveway (looking west)	390	339
<b>Dyer Avenue at North Site Driveway</b>		
<i>Stopping Sight Distance:</i>		
Dyer Avenue approaching from the north	155	500+
Dyer Avenue approaching from the south	155	500+
<i>Intersection Sight Distance:<sup>b</sup></i>		
Left turn from Site Driveway (looking north)	240	500+
Left turn from Site Driveway (looking south)	280	500+
<b>Dyer Avenue at South Site Driveway</b>		
<i>Stopping Sight Distance:</i>		
Dyer Avenue approaching from the north	155	500+
Dyer Avenue approaching from the south	155	500+
<i>Intersection Sight Distance:<sup>b</sup></i>		
Left turn from Site Driveway (looking north)	240	500+
Left turn from Site Driveway (looking south)	280	500+

<sup>a</sup>Recommended values obtained from *A Policy on Geometric Design of Highways and Streets*, 7<sup>th</sup> Edition; American Association of State Highway and Transportation Officials (AASHTO); 2018.

<sup>b</sup>Values shown are the intersection sight distance for a vehicle turning right or left exiting a roadway under STOP control such that motorists approaching the intersection on the major street should not need to adjust their travel speed to less than 70 percent of their initial approach speed.

As can be seen in Table 11, the sight distance at the intersection of the site driveway with Cranston Street was found to exceed the recommended values for SSD based on a speed of 35 mph, and the site driveways with Dyer Avenue were found to exceed the recommended values for both the SSD and ISD based on a speed of 25 mph.

# **TRAFFIC OPERATIONS ANALYSIS**

---

Measuring existing and future traffic volumes quantify traffic flow within the study area. To assess quality of flow, roadway capacity, and vehicle queue analyses were conducted under Existing, No-Build, and Build traffic-volume conditions. Capacity analyses provide an indication of how well the roadway facilities serve the traffic demands placed upon them, with vehicle queue analyses providing a secondary measure of the operational characteristics of an intersection or section of roadway under study.

## **METHODOLOGY**

### **Levels of Service**

A primary result of capacity analyses is the assignment of level of service to traffic facilities under various traffic-flow conditions.<sup>6</sup> The concept of level of service is defined as a qualitative measure describing operational conditions within a traffic stream and their perception by motorists and/or passengers. A level-of-service definition provides an index to quality of traffic flow in terms of such factors as speed, travel time, freedom to maneuver, traffic interruptions, comfort, convenience, and safety.

Six levels of service are defined for each type of facility. They are given letter designations from A to F, with level-of-service (LOS) A representing the best-operating conditions and LOS F representing congested or constrained operating conditions.

Since the level of service of a traffic facility is a function of the traffic flows placed upon it, such a facility may operate at a wide range of levels of service, depending on the time of day, day of week, or period of year.

### **Signalized Intersections**

The six levels of service for signalized intersections may be described as follows:

---

<sup>6</sup>The capacity analysis methodology is based on the concepts and procedures presented in the *Highway Capacity Manual 6<sup>th</sup> Edition*; Transportation Research Board; Washington, DC; 2016.

- *LOS A* describes operations with very low control delay; most vehicles do not stop at all.
- *LOS B* describes operations with relatively low control delay. However, more vehicles stop than LOS A.
- *LOS C* describes operations with higher control delays. Individual cycle failures may begin to appear. The number of vehicles stopping is significant at this level, although many still pass through the intersection without stopping.
- *LOS D* describes operations with control delay in the range where the influence of congestion becomes more noticeable. Many vehicles stop, and individual cycle failures are noticeable.
- *LOS E* describes operations with high control delay values. Individual cycle failures are frequent occurrences.
- *LOS F* describes operations with high control delay values that often occur with oversaturation. Poor progression and long cycle lengths may also be major contributing causes to such delay levels.

Levels of service for signalized intersections were calculated using the Percentile Delay Method implemented as a part of the Synchro™ 11 software as required by MassDOT. The Percentile Delay Method assesses the effects of signal type, timing, phasing, and progression; vehicle mix; and geometrics on “percentile” delay. Level-of-service designations are based on the criterion of percentile delay per vehicle and are a measure of: i) driver discomfort; ii) motorist frustration; and iii) fuel consumption; and include a uniform delay based on percentile volumes using a Poisson arrival pattern, an initial queue move-up time, and a queue interaction delay that accounts for delays resulting from queues extending from adjacent intersections. Table 12 summarizes the relationship between level-of-service and percentile delay and uses the same numerical delay thresholds as the *Highway Capacity Manual*<sup>7</sup> method. The tabulated percentile delay criterion may be applied in assigning level-of-service designations to individual lane groups, individual intersection approaches, or to entire intersections.

**Table 12**  
**LEVEL-OF-SERVICE CRITERIA**  
**FOR SIGNALIZED INTERSECTIONS**

Level of Service	Percentile Delay Per Vehicle (Seconds)
A	$\leq 10.0$
B	10.1 to 20.0
C	20.1 to 35.0
D	35.1 to 55.0
E	55.1 to 80.0
F	>80.0

<sup>7</sup>*Highway Capacity Manual 6<sup>th</sup> Edition*; Transportation Research Board; Washington, DC; 2016.

## **Unsignalized Intersections**

The six levels of service for unsignalized intersections may be described as follows:

- *LOS A* represents a condition with little or no control delay to minor street traffic.
- *LOS B* represents a condition with short control delays to minor street traffic.
- *LOS C* represents a condition with average control delays to minor street traffic.
- *LOS D* represents a condition with long control delays to minor street traffic.
- *LOS E* represents operating conditions at or near capacity level, with very long control delays to minor street traffic.
- *LOS F* represents a condition where minor street demand volume exceeds capacity of an approach lane, with extreme control delays resulting.

The levels of service of unsignalized intersections are determined by application of a procedure described in the *Highway Capacity Manual 6<sup>th</sup> Edition*. Level of service is measured in terms of average control delay. Mathematically, control delay is a function of the capacity and degree of saturation of the lane group and/or approach under study and is a quantification of motorist delay associated with traffic control devices such as traffic signals and STOP signs. Control delay includes the effects of initial deceleration delay approaching a STOP sign, stopped delay, queue move-up time, and final acceleration delay from a stopped condition. Definitions for level of service at unsignalized intersections are also given in the *Highway Capacity Manual 6<sup>th</sup> Edition*. Table 13 summarizes the relationship between level of service and average control delay for two-way STOP-controlled and all-way STOP-controlled intersections.

**Table 13**  
**LEVEL-OF-SERVICE CRITERIA**  
**FOR UNSIGNALIZED INTERSECTIONS<sup>a</sup>**

Level-of-Service by Volume-to-Capacity Ratio		Average Control Delay (Seconds Per Vehicle)
v/c ≤ 1.0	v/c > 1.0	
A	F	≤10.0
B	F	10.1 to 15.0
C	F	15.1 to 25.0
D	F	25.1 to 35.0
E	F	35.1 to 50.0
F	F	>50.0

## **ANALYSIS RESULTS**

Level-of-service analyses were conducted for 2023 Existing, 2028 No-Build, and 2028 Build conditions for the study area intersections. The results of the intersection capacity analysis within the study area are described below, with a tabular summary provided in Table 14 and Table 15.

### **Signalized Intersection**

#### **Cranston Street at Dyer Avenue**

Under 2023 Existing conditions, this intersection operates at an overall LOS C during the weekday morning and weekday evening peak hours. Under 2028 No-Build conditions, this intersection operates at an overall LOS E during the weekday morning and weekday evening peak hours. Under 2028 Build conditions, there is no change in the level of service during the weekday morning peak hour but the intersection operates at an overall LOS D during the weekday evening peak hour. The vehicle queue lengths increase up to 1 vehicle.

**Table 14**

<sup>a</sup>Volume-to-capacity ratio.

<sup>b</sup>Control (signal) delay per vehicle in seconds.

<sup>c</sup>Level of service.

<sup>d</sup>Queue length in vehicles.

NB = northbound; SB = southbound; EB = eastbound; WB = westbound; LT = left-turning movements; TH = through movements; RT = right-turning movements.

## **Unsignalized Intersections**

### **Dyer Avenue at Puritan Avenue/North Project Site Driveway**

It should be noted that no traffic volume was counted on the North Site Driveway. Under 2023 Existing conditions, the critical movement at this intersection operates at LOS C during the weekday morning and weekday evening peak hours. Under 2028 No-Build conditions, the critical movement at this intersection operates at LOS D during the weekday morning and weekday evening peak hours. Under 2028 Build conditions, the critical movements at this intersection operate at LOS E and LOS D during the weekday morning peak hour and at LOS D and LOS E during the weekday evening peak hour with no change in the queue length. Although LOS changes from D to E for the Puritan Avenue approach during the weekday evening peak hours, the average vehicle delay is expected to increase by less than 8 seconds, with no changes in the queue length, compared to the 2028 No-Build conditions.

### **Dyer Avenue at Governor Street/South Project Site Driveway**

Under 2023 Existing conditions, the critical movement at this intersection operates at LOS C during the weekday morning and weekday evening peak hours. Under 2028 No-Build conditions, the critical movement at this intersection operates at LOS D during the weekday morning and LOS C during the weekday evening peak hours. Under 2028 Build conditions, the critical movements at this intersection operate at LOS D and LOS E during the weekday morning peak hour. There is no change in the level of service during the weekday evening peak hour with no change in the queue length. Although LOS changes from D to E for the Governor Street approach during the weekday morning peak hour, the average vehicle delay is expected to increase by less than 7 seconds, with no changes in the queue length, compared to the 2028 No-Build conditions.

### **Cranston Street at Project Site Driveway**

Under 2023 Existing conditions, the critical movements at this intersection operate at LOS C or better during the weekday morning and the weekday evening peak hours. Under 2028 No-Build conditions, the critical movements at this intersection operate at LOS F during the weekday morning and at LOS E during the weekday evening peak hour. Under 2028 Build conditions, the critical movements at this intersection operate at LOS C during the weekday morning and the weekday evening peak hours.

### **Cranston Street at Haven Avenue**

Under 2023 Existing conditions, the critical movement at this intersection operates at LOS B during the weekday morning and weekday evening peak hours. Under 2028 No-Build conditions, the critical movement at this intersection operates at LOS B during the weekday morning peak hour and at LOS C during the weekday evening peak hour. No changes to the critical movement's level of service occur as a result of the addition of Project volumes under 2028 Build conditions.

## **RECOMMENDATIONS AND CONCLUSIONS**

---

VAI has prepared this TIAS in order to evaluate potential traffic impacts associated with the proposed mixed-use development to be located at 1381 Cranston Street in Cranston, Rhode Island. This study was prepared in accordance with industry guidelines for *Traffic Impact and Access Studies* as well as the Cranston City Plan Commission Policy for Traffic and was conducted pursuant to the standards of the traffic engineering and transportation planning professions for the preparation of such reports. Based on the results of this study, the following can be concluded:

- The Project is expected to generate 838 vehicle trips on an average weekday (two-way, 24-hour volume), with 63 vehicle trips (19 entering and 44 exiting) expected during the weekday morning peak hour and 73 vehicle trips (41 entering and 32 exiting) expected during the weekday evening peak hour. This is a reduction from the previous use on-site, which was estimated to generate approximately 304, 110, and 80 vehicle trips during the same respective time periods.
- The sight distance at the intersection of the site driveways with Cranston Street was found to exceed the recommended values for SSD based on a speed of 35 mph. The sight distance at the intersection of the site driveways with Dyer Avenue was found to exceed the recommended values for both SSD and ISD based on a speed of 25 mph.
- The analysis has indicated that the Project will generally result in decreased impacts on motorist delays and vehicle queue lengths at the study intersections compared with the previous use at the site.

## **RECOMMENDATIONS**

Access to the Project site will be provided via the one existing driveway onto Cranston Street and the two new driveways onto Dyer Avenue. The following recommendations are offered with respect to the promotion of alternative transportation and also to the design and operation of the Project site driveways:

- Public transit facilities and schedules for the transit services in the area should be posted in central gathering areas to encourage the use of transit by the project residents.
- The driveways should be placed under STOP-sign (*Manual on Uniform Traffic Control Devices* (MUTCD)<sup>8</sup> R1-1) control, with a painted STOP-bar included.
- All signs and other pavement markings to be installed within the Project site shall conform to the applicable standards of the current MUTCD.
- Signs and landscaping adjacent to the Project site driveways should be designed and maintained so as not to restrict lines of sight.
- Snow windrows within sight triangle areas of the Project site driveway should be promptly removed where such accumulations would impede sightlines.

## **CONCLUSIONS**

As documented in this study, Project-related traffic increases will not result in significant increases on overall traffic volumes or traffic delays within the study area. The site driveways will provide efficient access to and from the development. In general, the Project represents a decrease in traffic generation associated with the site as compared with the previous one. However, Project-related traffic can be adequately accommodated within the existing infrastructure with minimal impact on the traffic operations within the study area.

GROWTH RATE DATA

## Growth in VMT by Functional Class and County (2000 to 2020)

### 2020 Vehicle Miles Traveled by Functional Class by County

Functional System	County Code					
	1 Bristol	3 Kent	5 Newport	7 Providence	9 Washington	Sum
1 Rural Interstate	0	537	0	0	742	1,279
2 Rural Principal Arterial	0	79	0	190	85	353
6 Rural Minor Arterial	0	28	0	268	161	458
7 Rural Major Collector	0	76	31	204	174	484
8 Rural Minor Collector	0	5	5	21	54	84
9 Rural Local						0
11 Urban Interstate	0	1,539	0	4,913	12	6,465
12 Urban Other Freeway & Expressway	63	402	381	1,705	862	3,412
14 Urban Principal Arterial	335	1,302	657	3,581	552	6,427
16 Urban Minor Arterial	107	425	281	1,901	294	3,009
17 Urban Collector	89	349	179	1,351	264	2,232
19 Urban Local						0
Sum	595	4,741	1,532	14,133	3,201	24,202

### 2020 Number of Links by Functional Class by County

Functional System	County Code					
	1 Bristol	3 Kent	5 Newport	7 Providence	9 Washington	Sum
1 Rural Interstate	0	20	0	0	25	45
2 Rural Principal Arterial	0	15	0	35	23	73
6 Rural Minor Arterial	0	10	0	40	47	97
7 Rural Major Collector	0	20	19	52	107	198
8 Rural Minor Collector	0	4	8	35	63	110
9 Rural Local						
11 Urban Interstate	0	155	0	428	40	623
12 Urban Other Freeway & Expressway	9	72	48	227	151	507
14 Urban Principal Arterial	105	301	187	1,290	214	2,097
16 Urban Minor Arterial	56	160	140	1,126	146	1,628
17 Urban Collector	105	213	182	1,093	201	1,794
19 Urban Local						
Sum	275	970	584	4,326	1,017	7,172

### Total Growth (2000 to 2020) by Functional Class by County

Functional System	County Code					
	1 Bristol	3 Kent	5 Newport	7 Providence	9 Washington	Sum
1 Rural Interstate		1.16			1.15	1.15
2 Rural Principal Arterial		1.48		1.26	1.28	1.31
6 Rural Minor Arterial		1.35		1.25	1.19	1.23
7 Rural Major Collector		1.33	1.19	1.18	1.26	1.23
8 Rural Minor Collector		2.79	1.18	1.25	1.30	1.32
9 Rural Local						
11 Urban Interstate		1.18		1.19	1.25	1.18
12 Urban Other Freeway & Expressway	1.08	1.14	1.14	1.12	1.30	1.17
14 Urban Principal Arterial	1.11	1.16	1.13	1.13	1.23	1.14
16 Urban Minor Arterial	1.18	1.17	1.14	1.16	1.13	1.15
17 Urban Collector	1.20	1.22	1.10	1.19	1.21	1.19
19 Urban Local						
Sum	1.13	1.18	1.13	1.16	1.22	1.17

**Bold - Indicates insignificant number of links to make growth reliable (less than 45 links)**

**Bold values should not be used. The total statewide growth by functional class should be used instead.**
